set {}

```
In [ ]: - pop()
        - add()
        - discard()
```

- empty {} called dict - if similar datatype, it is in ordered different datatype, it is unordered - duplicates not allowed - only 1 argument is allowed in add() func - index & slicing not allowed - pop() gives random value given in the set pop(index) --> error - only 1 argument allowed - discard() --> never error discard(value) --> remove that value - remove() --> error
